Boost your metabolism

Posted Sep. 22, 2014 @ 9:00 am
Updated Sep 22, 2014 at 10:03 AM

There are many factors that can cause your metabolism to slow and the number on the scale to creep up. The good news is you can always fight your metabolic triggers and change your metabolism for the better. [Everydayhealth.com](#) says top docs agree you can reverse a bad metabolic trend and rev your body's calorie-burning engine.

Here's some things to consider:

How Hormones Slow Metabolism, Part I

You could blame your slow metabolism on your hormones — or a lack thereof. A natural lack of estrogen receptors in the brain due to aging caused mice to gain weight without consuming more calories, researchers at the University of Texas Southwestern Medical Center found. The same principle could apply to humans. "People put on 10 percent a decade because of how our hormones change as we age," says Eva Cwynar, MD, an endocrinologist and metabolic medicine specialist in Beverly Hills and author of "The Fatigue Solution." If you're concerned about your estrogen levels, talk to your doctor to find a healthy solution that works for your body.
